

Instructions

Push the **ON/OFF** button to turn the machine on and off. Turn the amplitude button to set the height of the **green light**, so that it starts moving up and down. Set the frequency of the flashing of the **green light** between **7 Hz and 12 Hz** by turning the pulse button. The higher the laser line, the higher the frequency. 1.5 seconds after the setting is done, the treatment starts and the **green line** starts moving. When you turn the machine off, it will memorize the values set and will start working according to these values when it is switched on the next time.

The machine works with **rechargeable battery**. If the *bat* indicator is red, the battery is running low. While charging the battery, the *bat* indicator is flashing until the battery is charged.

WHERE TO PURCHASE IT?

You can purchase **K-Sweep** from:

CINAK

Chemin des Semailles 47
1212 Grand-Lancy
Genève- Switzerland

Tel: +41 (0) 22 796 94 64

Email: info@cinak.com

Presents :

K-Sweep

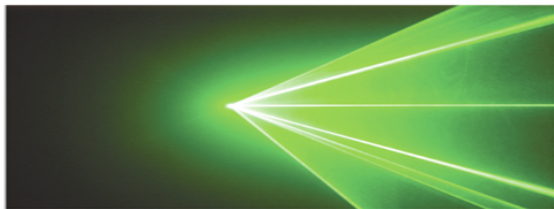

Green Light Machine to scan quicker the entire
system and find new treatment solutions!

SOME HISTORY...

THE scanning with the **green light** has its origins in science. Studies showed: if injured neurons are scanned with an exact **frequency**, they start to emit completely normal action potentials as if the nerve was healthy. Moreover, the injury healed much faster, and negative long term effects did not occur.

According to Dr. Klinghardt, MD, PhD, many doctors already work with the **green light**, using a glass rod to break the beam into a scanning line. This allows the practitioner to scan the entire system of the patient within a very short amount of time. Dr. Klinghardt repeatedly confirmed a deep and lasting effect of the **green light scan** on the healing of the nerve tissue. He observed many other positive effects: *the reorganization of the system with food allergies, detoxification, resurfacing of suppressed emotions and memories.*

HOW DOES IT WORK?

Process

DIFFERENT *remedies are scanned into the system during the green light session, so that the body reacts as if it had actually received these remedies.*

The treatment time is about **20-25 minutes**. The patient then needs to be retested over several hours or even days in order to find out how long the effect lasts, and to be re-scanned when it decreases. Usually *the effect lasts as long as it would have lasted if the patient had physically taken the drug*. However, there are some exceptions where it remains important for the patient to take the substance, even if the necessary dosage of it can be reduced by scanning at regular intervals.

To make the treatment available for everyone, we designed a machine, **K-Sweep**, making a sweeping movement, so no extra person is needed to scan the patient.

After turning the machine ON, the **green light** will start moving according to your setting, so **you can do it on your own!**
